

Filter range selection chart

How to choose a filter

The choice of the **respiratory protection filter** depends on the conditions of the environments in which it will be used and the inherent risks. When selecting the filter it is necessary to take into account protection factors, the type of filter used, the filtration capacity of the device and to analyze the environment conditions.

Protection factor

It is necessary to know the concentrations and the occupational exposure limits related to the contaminants you want to protect from, on which ratio the minimum protection factor required will be determined (EN 529). The protection factor of the Personal Protective breathing equipment refers to intact and correctly used devices.

There are two main classifications:

1. Nominal Protection Factor (NPF): minimal level of protection the equipment has to demonstrate under laboratory conditions to gain approval to the appropriate class of the performance standard.

2. Assigned Protection Factor (APF): EN 529 acknowledges that laboratory performance may not be achievable in real use. Figures are taken from EN 529 and are the minimum level of protection calculated for 95% of trained wearers using the equipment in the workplace. The Assigned Protection Factor may vary from country to country. Figures quoted by **DPI** are those valid in Italy.

Device	Protection	NPF	APF
Half mask filtering facepiece	FFP1	4	4
	FFP2	12	10
	FFP3	50	30
Half mask with particulate filter	P1	4	4
	P2	12	10
	P3	48	30
Full face mask with particulate filter	P1	5	4
	P2	16	15
	P3	1000	400
Half mask with gas filter	--	50	30
Full face mask with gas filter	--	2000	400

Type of filter

Contaminants may be present in different forms, such as particulate gas or a combination of both. Therefore the type of filter that can offer greater protection for the risk must be chosen. According to EN 14387 and EN 143, the **various types of filters** are recognizable by distinctive colours as below:

Colour	Filter type	Main field of application
 Brown	AX	Gases and vapours of organic compounds with boiling point < 65 °C
 Brown	A	Gases and vapours of organic compounds with boiling point > 65 °C
 Grey	B	Inorganic gases and vapours e.g. chlorine, hydrogen sulphide, hydrogen cyanide
 Yellow	E	Sulphur dioxide, hydrogen chloride
 Green	K	Ammonia
 Black	CO	Carbon monoxide
 Red	Hg	Mercury vapours
 Blue	NO	Nitrous gases, including nitrogen monoxide
 Orange	Reaktor	Radioactive iodine including radioactive methyl iodide
 White	P	Particles, dust and mist
 Purple	SX	Special types on request

Class of filter

In addition to the type of filtering device, you must choose the appropriate class of the filter. Here below are the concentrations required by **EN 14387** and **EN 143** of toxic substances according to the filtration device class:

Type of filter	Filtration class	Maximum protection allowed	
ANTIGAS FILTERS	1	0.1% vol	Capacity
	2	0.5% vol	
	3	1.0% vol	
PARTICULATE FILTERS	1	4*T.L.V.	Efficiency
	2	12*T.L.V.	
	3	50*T.L.V. (with half mask) / 100*T.L.V. (with full face mask)	

N.B. Do not use filtering devices:

- In the atmosphere with oxygen deficiency (<17%);
- In poorly ventilated or confined spaces;
- In cases where types or concentrations of toxic substances are not known, or where you can run into immediate risk to health;
- At concentrations higher than those allowed by chosen protector devices;
- With substances that cannot be perceived;
- With asphyxiating substances.

You must leave the contaminated area and then remove the device if:

- Breathing becomes difficult;
 - You begin to perceive smells;
 - Dizziness, irritation or other events appear;
 - The device is damaged.
- Make also sure that there are no toxic gases if you use a particulate filter and, conversely, make sure that there are no contaminants in the form of particulate if you use a gas filter. The device has a filter efficiency only if correctly worn.

Lifetime of the filter

The lifetime of the filter **depends on the class and on the conditions of use**: several factors affect the duration of the device such as the humidity and the temperature of the inhaled air, the consumption of air by the user and the concentrations and combinations of toxic contaminants in the environment, affect the duration of the device. For these reasons it is not possible to specify a lifetime of the device if even one factor is unknown. Usually the breaking of the filter is shown by the perception of odours. With regards to particulate filters, the lifetime of the device is indicated by the filter clogging, resulting in an increase of respiratory resistance.

In the below table* are reported some of the main toxic contaminants, their **TLV-TWA** (Time Weighted Average) and **STEL** (Short term exposure limit) values and the type of device suggested.

WARNING: If TLV-TWA and STEL values are very low always USE full face masks.

*Table updated following the Decree of the Minister of Labour and Social Policy and the Minister of Health of 18 May 2021 transposing Directive No 2019/1831/EU establishing a fifth list of indicative occupational exposure limit values in implementation of Directive 98/24/EC.

Occupational exposure limit values

N.CE(1)	CAS (2)	NAME OF CHEMICAL SUBSTANCE	LIMIT VALUES				NOTATION (3)	FILTER TYPE

Table notes

- (1) EC number: EC number (European Community) - numerical identifier of substances within the European Union.
- (2) CAS: Chemical Abstract Service Registry Number.
- (3) The notation of the term "skin" for an occupational exposure limit value indicates the possibility of absorption significant through the skin.
- (4) Measured or calculated in relation to a reference period of eight hours, as a time weighted average (TWA).
- (5) Short Term Exposure Limit (STEL). Limit value that must not be exceeded. The reference period is 15 minutes, unless otherwise specified.
- (6) mg/m: milligrams per cubic meter of air. For chemicals in the gaseous or vapor phase the limit value is expressed at 20°C and 101.3 kPa.
- (7) ppm: parts per million by volume of air (ml/m³).
- (8) The detection method must simultaneously detect dust and vapour.
- (9) When monitoring exposure to mercury and its inorganic divalent compounds, it is necessary to keep in mind the related biological monitoring techniques that complement the occupational exposure limit values.
- (10) When selecting an appropriate exposure monitoring method, limitations and interference should be taken into account potentials that may result from the presence of other phosphorus compounds.
- (11) Nebulization is defined as the thoracic fraction.
- (12) Inhalable fraction.
- (13) Respirable fraction.
- (14) Short term exposure limit value in relation to a 1 minute reference period.
- (15) During exposure monitoring it is appropriate to keep in mind the relevant biological monitoring values, as suggested by the Scientific Committee for Occupational Exposure Limits to Chemical Agents (SCOEL).
- (16) According to the provisions of Article 3 of Directive no. 2019/1831 / EU the reference to cumene is deleted with effect from 20.
